September 20, 2013

Unemployment Rate for August Holds Steady at 9.5 Percent

Carson City, NV —Nevada's unemployment rate remained at 9.5 percent for the month of August. The state added 11,200 jobs, the largest monthly gain in eight years.

"I am pleased to see that August brought with it the strongest month-to-month job gain since April 2005," Governor Brian Sandoval said. "After all of the monthly ups and downs, we appear to be on track to add approximately 20,000 jobs in 2013, on top of the combined 30,000 created in 2011 and 2012. While recent evidence suggests that we are headed in the right direction, our stubbornly high unemployment rate illustrates that much room remains for improvement."

Las Vegas' rate of unemployment ticked down from 9.7 percent to 9.6 percent, while adding 9,600 jobs. For the northern metro areas, the Reno/Sparks rate dropped from 9.3 percent to 9.1 percent and the region added 2,200 jobs, while Carson City's rate of unemployment dropped from 9.5 percent to 9.4 percent, but shed 200 jobs. Over-the-year, the jobless rate in Nevada dropped 1.5 percentage points. Las Vegas is down by 1.8 percentage points from a year ago, Reno is down by 1.5 points, and Carson City's rate fell by 1.2 percentage points.

"Accounting for the volatile nature of the monthly estimates, perhaps it is best to look at the summer of 2013 as a whole," Anderson said. "From June through August, jobs levels have increased by 7,900. This is the best summer Nevadans have experienced since 2005, which is a little surprising in light of the sharp decline in July, in advance of August's gain."

All of Nevada's major sectors added employment over-the-month except financial activities, which lost 100 jobs. The private sector increased by 10,000, while government employment rose by 1,200 over-the-month.

NEVADA LABOR MARKET OVERVIEW August 2013

On the heels of July's revised loss of 8,500 jobs, Nevada's economy demonstrated resilience by adding 11,200 jobs (seasonally adjusted) in August. Although we have previously emphasized not to place too much weight on one month's movement, August's gain of 11,200 jobs is noteworthy in that it represents the largest month-over-month gain since early-2005. At the same time, July's decline was the largest since early-2009.

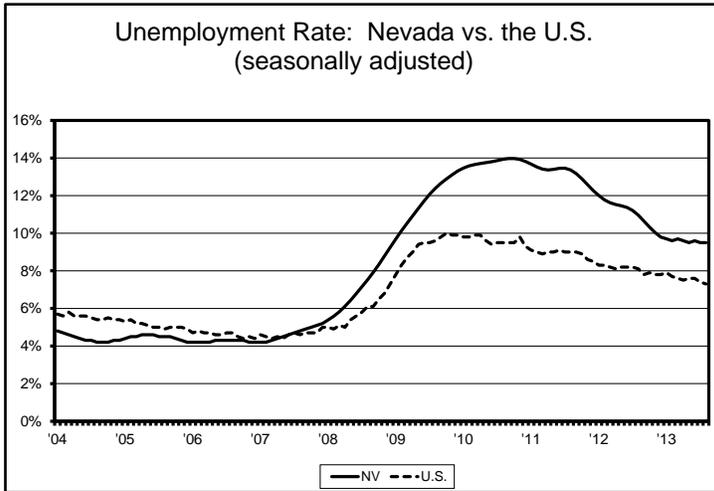

Some astute readers may have noticed the seesaw like movements in the month-to-month comparison – one month up, the next one down so far in 2013. Accounting for the volatile nature of the monthly estimates, perhaps it is best to look at the summer of 2013 as a whole. From June through August, jobs levels have increased by 7,900. This is the best summer Nevadans have experienced since 2005, which is a little surprising in light of last month's sharp decline. To drive home the point, one month's movement does not signal a new trend, but rather highlights the month-to-month volatility of sample estimates, or

sampling error. After considering a number of different methods and data sources, a good gauge of the true yearly increase is around 20,000 to 25,000 jobs.

While the monthly estimates do experience ups and downs, a broader view of recent trends offers a picture of unequivocal and consistent growth in Nevada's job market. In August of this year we have 25,200 more jobs than in August of 2012. Further, a different perspective, using year-to-date job growth relative to last year, yields an addition of 22,300 during the first eight months of this year.

The Statewide unemployment rate held steady at 9.5 percent over-the-month, firmly maintaining the single

digit range for all of 2013. Job growth in Las Vegas totaled 9,600 with the unemployment rate registering 9.6 percent¹. For the northern metro areas, Reno/Sparks added 2,200 jobs and Carson City shed 200 with unemployment rates of 9.1 and 9.4 percent, respectively. Over-the-year, the jobless rate in Las Vegas is down by 1.8 percentage points from a year ago, Reno is down by 1.5 points, and Carson City's rate fell by 1.2 percentage points.

Nevada and Sub-State Nonfarm Jobs: July - August Change			
	Unadjusted Change	Expected Seasonal Movement	Seasonally Adjusted Change
Total Nonfarm Jobs	12,800	1,600	11,200
Private Sector	12,600	2,600	10,000
Public Sector	200	-1,000	1,200
Las Vegas	10,000	400	9,600
Reno	2,600	400	2,200
Carson City	-100	100	-200

¹ Unemployment rates for the State's metropolitan areas and counties reported here are not adjusted for seasonality. Hence, comparisons to the State's seasonally adjusted rate should be avoided. Legitimate comparisons, however, can be made to the State's unadjusted rate – 9.4 percent in August, down from 9.5 percent in July and 11.1 percent in August 2012.

Typically, August non-agricultural employment rises by about 1,600 relative to July. This year, however, 12,800 jobs were added, resulting in the seasonally adjusted gain noted above. All of Nevada's major sectors added employment over-the-month except financial activities, which lost a mere 100 jobs. The private sector increased by 10,000, while government employment rose by 1,200 over-the-month.

Improvement in the statewide economy has spread into the housing market. Sales prices of homes in Nevada increased by 22.8 percent in 2013:IIQ. This is the most pronounced gain of any state, according to the Federal Housing Finance Administration (FHFA). Since bottoming out in the final months of 2011, prices are up by approximately one-third.

Nationwide, prices bottomed out in mid-2011 and have increased nearly 11 percent since. Despite a relatively weak July, housing starts in the State are up 32 percent from a year ago through the first seven months of the year. Statewide housing permit activity is up 30 percent so far this year. So, all things considered, housing activity appears to be on the mend.

Construction employment has benefitted from the uptick in residential activity, albeit off of historical lows. Our complete count of jobs obtained from wage records submitted by employers covered by the unemployment insurance system, and reported under the Quarterly Census of Employment and Wages (QCEW) Program² shows that the construction sector added 4,700 jobs in this year's first quarter compared to a year ago, the most of any super-sector. Elsewhere, job gains were widespread with ten out of 11 super-sectors adding to payrolls. Other notable gains are found in professional and business services (4,700 jobs) and leisure and hospitality (3,900). Information was the sole super-sector with job losses,

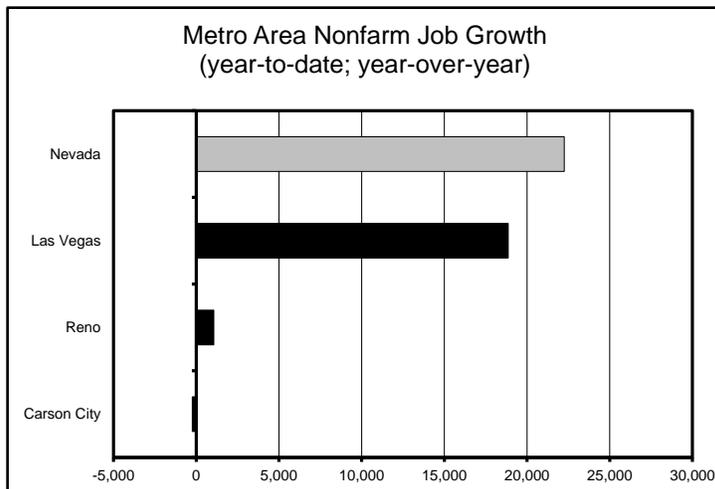

but the decline was less than 100.

Even with a looming slowdown in mining as gold prices have eased considerably, hundreds of new jobs were added to the payrolls in 2013:1Q. Average wages in the mining industry are unsurpassed by any other super-sector. Because mining dominates some of Nevada's rural counties, high wages in mining translate into higher average wages for these counties. Eureka County claims the top position for highest average annual wage at \$84,000, followed by Lander at \$63,100 and then Humboldt at \$50,200. Mining employment accounts for over 90 percent of all jobs in Eureka County. The counties containing the State's metropolitan areas are more diversified, causing their average

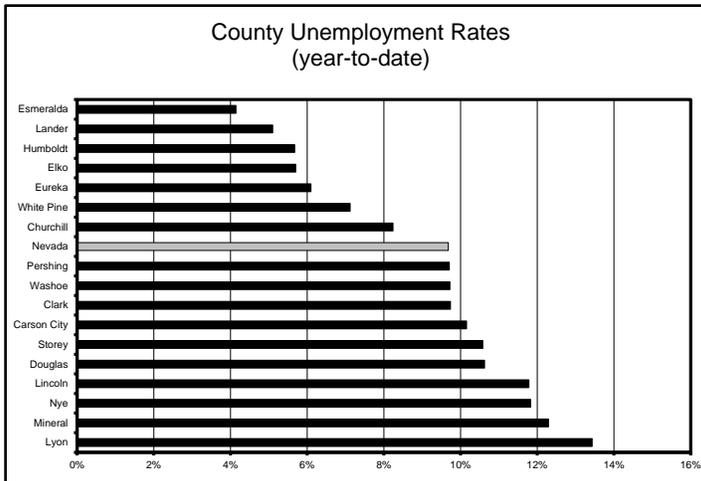

wages to fall in the middle of the bunch. Clark County's average annual wage is \$43,100, and the lowest average wage is in Lincoln County at \$33,000.

Last month, we noted a growing debate concerning the "quality" of Nevada's recent job growth. Some might argue that the net gains of late have been concentrated in part-time, low-wage industries/occupations.

This month, we revisit that issue and look at job gains/losses from a wage perspective, utilizing information from Economic Modeling Specialists, Inc. (EMSI). It is estimated that net private sector job growth over the 2010-2013 recovery period will be about 52,200. Economy-wide,

² Information obtained through the QCEW Program provides a complete job count based upon quarterly wage records submitted by employers covered under the Unemployment Insurance System. Because generating this information is a time-consuming process, it is only available with a 4-5 month lag. In contrast, Current Employment Statistics are released every month, are sample based, and provide a more timely estimate of the current labor market. CES estimates are re-aligned to the QCEW count near the beginning of each year.

Nevada has not seen appreciable wage growth since 2007. Six years on and nominal wages are up by \$42 a week. Had wages kept up with inflation, the average weekly wage would have been \$905. A return to more noticeable wage growth would go a long way towards ensuring a continuation of our recent economic gains.

average wages are estimated to be \$42,200 annually. Some industries have declined over the period. EMSI estimates suggest that those industries accounted for gross job losses totaling 26,000 over the three-year period. Furthermore, these industries pay wages which are just slightly above average, at \$42,700. Growing industries account for gross job additions of 78,200 and pay wages just slightly below average, at \$41,900. This evidence suggests that differences in the wage structures of growing and declining industries are minimal. In sum, it does not appear that Nevada is losing “good” jobs and replacing them with “bad” jobs. At the same time, available evidence does not suggest any upward pressure on the State’s wage structure, either.

Other available evidence supports this last conclusion. Average weekly wages in the State during the first quarter of this year show that wages are essentially unchanged from a year ago in nominal terms (\$844 per week during the first three months of this year vs. \$846 a year ago), though this does mean wages are declining in real terms. In fact,

As Nevada’s recovery progresses, economists in the Research and Analysis Bureau are sometimes asked for an appropriate “target” for the number of unemployed Nevadans. A brief history shows that the State had unusually low levels of unemployed through 2007, where it never broke above 64,000. Then as the recession took hold, the number of unemployed swelled to unprecedented heights. In 2010, the State averaged over 192,000. As of August, the number has fallen to a year-to-date average of 133,000, a drop of 59,000 from the peak.

Given that our economy has grown over time, we cannot expect to return to unemployed levels of 60,000 or below, and we certainly do not want to be in the 150,000+ range either. So what is an appropriate level? The average unemployment rate since 1976 is 6.7 percent. At the current labor force level, this rate would yield an “acceptable” tolerance of 92,000 unemployed Nevadans. Perhaps an appropriate “goal” with psychological appeal, which would also allow for labor force growth, would be 100,000

unemployed Nevadans. The goal does appear attainable. From 2011-2012, the number of unemployed declined by over 30,000. Through the first eight months of this year, the number of Nevadans counted amongst the unemployed has eased by an additional 27,000.

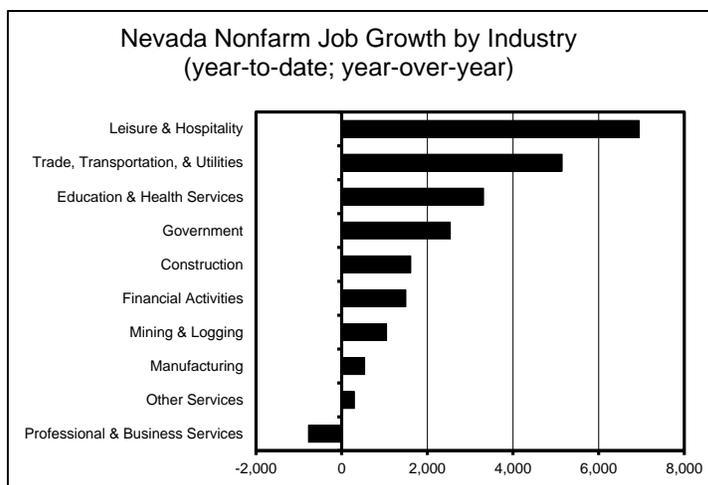

In last month's *Overview*, we examined small business job growth. This month, we take a more thorough look at employment changes across all private employment size classes. Results from this year's first quarter (the most recent information available) show job growth across all establishment size classifications, except in those establishments with 500-999 workers, where job readings fell by 3,200 relative to the first three months of 2012. Largely, the decline resulted from a number of firms either moving into higher size classes and a few moving into the lower classes. Small establishments in the 20-49 employee size class increased employment the most on a year ago basis, adding 7,200 jobs. Those establishments with no more than four employees added

close to 800 jobs over the year. The State's largest establishments, those with at least 1,000 jobs, were home to 3,100 more workers in the first three months of this year relative to the same period in 2012.

Examining QCEW job growth rates over time, and for all 50 states (plus the District of Columbia), highlights Nevada's relative performance during the pre-recessionary boom, throughout the downturn, and into the early stages of the recovery. In the years preceding the economic downturn, Nevada led the country in employment growth. Indeed, Nevada had the highest private sector employment growth rate in the country in 2003 (3.5 percent), 2004 (6.4 percent), and 2005 (6.4 percent). Conversely, during the recession, Nevada was the most affected state in terms of employment growth. In fact, Nevada's employment growth was the lowest in the nation in 2009 (-10.1 percent) and 2010 (-2.8 percent). With the release of 2012:IVQ data for all states, we can consider Nevada's performance over the full year. We are currently

growing at an annual rate of 1.9 percent, which is a higher rate than half of the other states in the nation. When we consider only the fourth quarter of 2012 against the same period in the previous year, Nevada's employment gains outpaced 31 states with a growth rate of 2.1 percent.

Nevada exports grew by a remarkable 28 percent in

2012, and we were one of 11 states achieving double-digit growth over the previous year. So far in 2013, export activity lags 2012 values by six percent through June. At the helm of 2013's contraction are primary metal exports, down by \$442.1 million (-17 percent) year-to-date. Gold prices, which are highly correlated with primary metal exports for obvious reasons, are down 11 percent year-to-date. Nevada's second largest export category, miscellaneous manufacturing, which includes gaming machines, is up \$157.6 million over-the-year. This category has shown steady growth since 2009 and achieved a new record in export value in 2013:IIQ.

improvement in Nevada in the months ahead.

The Nevada economy is very much dependent upon the willingness of consumers (including tourists) to spend their disposable income here. The Conference Board's Consumer Confidence Index measures consumers' perception of the economy's health and is an important indicator of near-term economic growth in that consumer spending accounts for about two-thirds of U.S. economic activity. In August, the Consumer Confidence Index jumped to its highest level in five years. On a related note, individuals are also becoming more confident in the health of the labor market. The share of Americans saying jobs are "hard to get" dropped to its lowest reading since September 2008. Consumers appear to be more upbeat about the labor market both in terms of jobs and income, according to August data. Hopefully, this will translate into continued labor market
