PRESS RELEASE

For Immediate Release
November 22, 2013

Jobless Rate in Nevada Registers at 9.3 Percent for October

Carson City, Nv —Nevada's unemployment rate nudged down to 9.3 percent in October; however, the labor market added 7,400 jobs unlike September's loss of 8,800. September's unemployment rate was revised up to 9.4 percent from the previously reported 9.3 percent.

"While Nevada continues to experience monthly volatility, overall the Silver State is headed in the right direction," said Governor Brian Sandoval. "To continue the momentum of economic recovery, we must cultivate diverse industry opportunities and support jobseekers in skills training."

Las Vegas saw an increase of 4,800 jobs for the month, while Reno gained 1,600 jobs, said Bill Anderson, chief economist for Nevada's Department of Employment, Training and Rehabilitation. Relative to last year, employment in the Las Vegas valley has increased by 17,500, a 2.1 percent growth rate. Unemployment rates in each of the state's three population centers stand at their lowest October readings since 2008. Reno has the lowest rate, at 8.8 percent for September and October. Las Vegas' rate registered at 9.4 percent for both September and October, while in Carson City's, rate increased from September's 9.4 percent to 9.6 percent in October.

Heading into the holiday season, Anderson said Nevada is expected to fare well.

"Our expectation is to match or exceed 2012's holiday-related seasonal gains," Anderson said. "While we are still below pre-recessionary levels, this is good news for those who depend on holiday hiring for an opportunity to return to work or to supplement their income."

Last year, seasonal employment rose by 10,400 jobs from September to December.

NEVADA LABOR MARKET OVERVIEW October 2013

Nevada's labor markets continued on a path of moderate improvement in October. Nonfarm employment increased by a seasonally adjusted 7,400 relative to September's readings, and the unemployment rate was little changed at 9.3 percent. Compared to October 2012, payrolls are up 20,200, or 1.8 percent, while the unemployment rate has declined by one percentage point. Five of Nevada's super-sectors increased employment over-the-month, four realized declines, and one had no change.

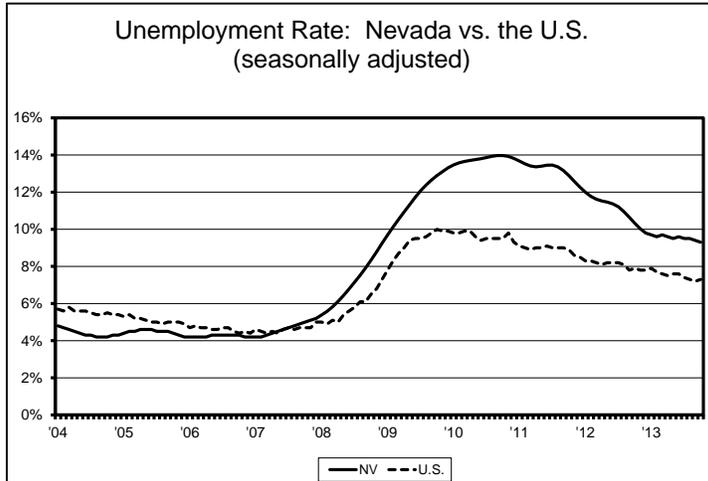

The State's largest MSA, the Las Vegas-Paradise-Henderson area, increased employment by 4,800 for the month. Relative to last year, employment in the Las Vegas valley has increased by 17,500, a 2.1 percent growth rate. The Las Vegas MSA is recovering quicker than the smaller MSAs and rural areas. The Reno area added 1,600 jobs as compared with September. On a yearly basis, the area's employment base increased by 1,800 jobs, or 0.9 percent. Carson City's economy still struggles and has lost 700 jobs, or

-2.5 percent, relative to one year ago. The balance of state areas, which comprise the rural counties, added 1,600 jobs over-the-year, an increase of 1.3 percent.

Unemployment rates in each of the State's three population centers stand at their lowest October readings since 2008¹. Reno is home to the lowest jobless rate, at 8.8 percent. Las Vegas' rate is 9.4 percent, while in Carson City, the rate stands at 9.6 percent. Five

¹ Unemployment rates for the State's metropolitan areas and counties reported here are not adjusted for seasonality. Hence, comparisons to the State's seasonally adjusted rate should be avoided. Legitimate comparisons, however, can be made to the State's unadjusted rate – 9.2 percent in October. September's reading was also 9.2 percent.

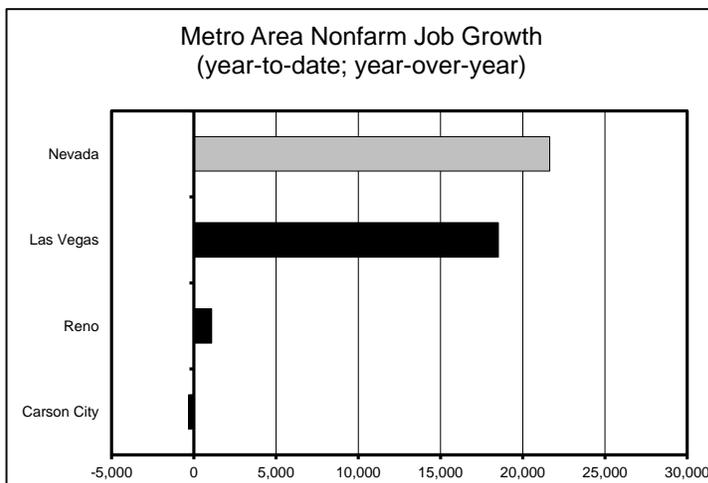

counties are home to unemployment rates through the first ten months of the year that are, roughly, six percent or lower...all of them are rural.

As we've been noting in recent *Overviews*, Nevada is steadily climbing up the job growth rankings. Another way to examine our relative performance is via "shift-share" analysis. This tool decomposes regional employment growth over time into three components: (1) the national growth effect assumes regional employment in each industry grows/declines at the same rate as total employment in the

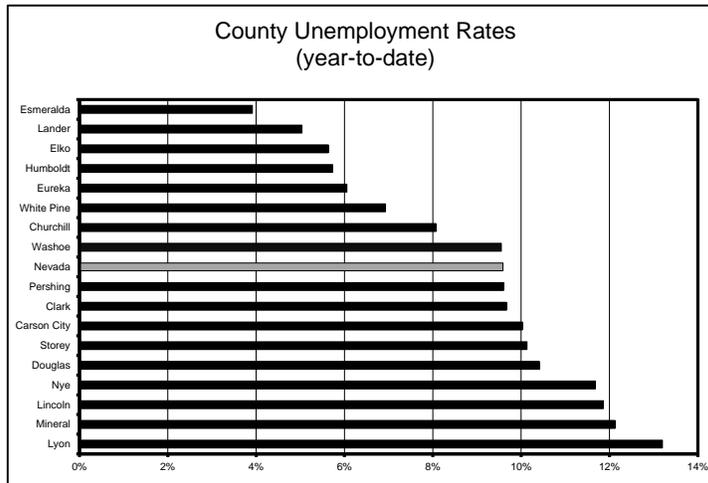

nation; (2) the industry mix effect is the portion of employment change for a given industry due to the relative performance of that specific industry nationally; and (3) the competitive effect (the most important of the three) measures how much change is due to regional, rather than national, factors.

Over the last decade, Nevada employment growth has come in just as expected, given national macroeconomic and industry trends. Employment in Nevada has increased by nearly 76,000 since 2003. Over that time, the State's competitive share was less than 400, suggesting that essentially all of our job gains over the past ten years were attributable to national trends.

However, that masks considerable differences over the pre- and post-recessionary periods. Prior to the downturn, Nevada turned in job gains well above those consistent with national and industry conditions. In other words, the State maintained a positive competitive share. Indeed, in 2004 and 2005, job growth was more than 40,000 higher than expected, given broader trends. During and immediately following the recession, Nevada job losses were much more pronounced than anticipated, and subsequent gains were not as pronounced as expected.

For instance, in 2009, Nevada's job declines were about 50,000 greater than what can be explained by national trends. It hasn't been until this year that the State's competitive share has, once again, turned positive, suggesting that Nevada's job gains are exceeding expectations.

During the holiday season, the trade and transportation sector bustles. This month we examine the likely impacts on hiring. In the years prior to the recession, September-December increases in holiday-related seasonal jobs reached 10,000 in Nevada. During the recession and early stages of recovery, seasonal gains eased noticeably. However, more recently, holiday-related job growth has picked up in these industries. For instance, in 2012, seasonal employment in these industries rose by 10,400 from September through December. In that the economy has strengthened further from a year ago, our expectation is to match or exceed 2012's holiday-related seasonal gains.

Retailers not only move more inventory this time of year, but they also purchase marketing products and related services, stimulating activity in the professional and business services sector. The professional & business services sector added 1,200 jobs (+0.9 percent) in October after shedding 7,500 in September. This sector houses temporary employment services and convention services; both of which both can be highly variable in employment levels.

Nevada's economy is standing taller than last year and apt to have a buzzing trade sector. In October we expected at least 700 additional jobs in the trade, transportation and utilities (TTU) sector given historical trends. This year, however, 5,100 jobs were created, yielding a 4,400 seasonally adjusted gain. Year-to-date the sector is up 5,700, and only the leisure and hospitality sector (+6,700) has added more jobs. Additionally, the well-paid goods-producing industries of mining (+1,000), construction (+1,500) and manufacturing (+500) are up a combined 3,000 jobs. The bottom line is that more jobs equal more disposable income flowing through the economy, as long as wages hold their purchasing power.

To accurately gauge wage growth in Nevada, the effect of inflation must be taken into consideration. Nominal wages in Nevada have increased by 29 percent from 2002 to 2012, while

Nevada and Sub-State Nonfarm Jobs: Sept. - Oct. Change			
	Unadjusted Change	Expected Seasonal Movement	Seasonally Adjusted Change
Total Nonfarm Jobs	10,300	2,900	7,400
Private Sector	8,000	-600	8,600
Public Sector	2,300	3,500	-1,200
Las Vegas	6,700	1,900	4,800
Reno	2,700	1,100	1,600
Carson City	-100	100	-200

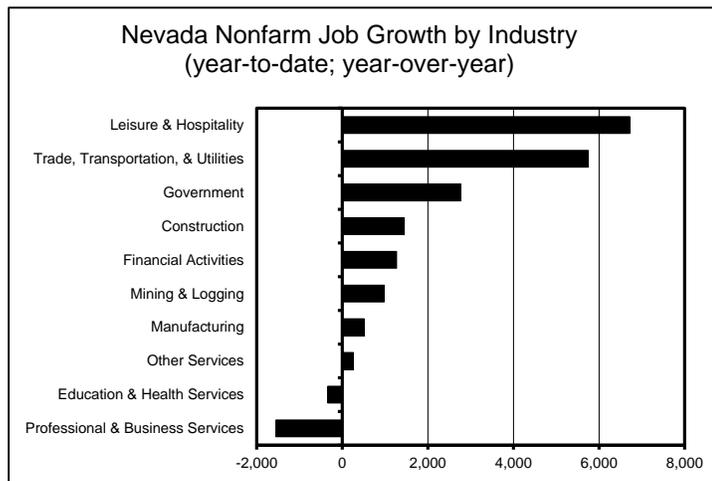

cumulative inflation for the same time period has risen by a nearly identical 28 percent. Inflation alters the actual cost of living; when inflation increases, purchasing power decreases. Comparing the two measures illustrates that wage growth in Nevada has only narrowly kept pace with inflation over this 10 year time span. Between 2001 and 2007, real wages increased 9 percent, and subsequently fell by 7 percent between 2007 and 2012. From 2002 to 2012, real wages in Nevada have increased by just one percent.

A recent study of the ratio of the tourism/gaming/entertainment sector employment to total employment revealed that Nevada has the highest ratio in the nation by far. It is a known fact that approximately one-third of Nevada's workforce is employed in these industries, but surprisingly, the next highest was only at 23 percent (Hawaii). A platitude developed over the course of the recovery is that Nevada's economic health is strongly

correlated with the national economy. A good barometer of tourism's health in the nation is the US travel and tourism satellite account produced by the Bureau of Economic Analysis.

Real U.S. travel and tourism spending advanced 7.3 percent in the 2013:IQ and slowed to a moderate pace of 2.5 percent in 2013:IIQ. Gains have been recorded in 13 of the past 14 quarters. A deceleration in "domestic and international air travel" and the sub-category "automotive rental and leasing" attributed to moderating the travel and tourism growth rate. In the second quarter, tourism-related spending grew at the same pace as the national economy. Overall, it has been growing stronger than the national economy since about mid-2010. Should these trends continue, Nevada's tourism/gaming/entertainment sector stands to benefit.

Over time, the two main drivers of Nevada's stellar economic performance prior to the most recent recession were gaming and

construction. One of the primary goals of Nevada's economic development efforts is to diversify the State's economy to help facilitate more broad-based growth. It is interesting to note that diversification within the State's broadly-defined tourism/gaming/entertainment sector has already been occurring for the past few decades. For instance, over the past ten years, the strongest job gains within the sector have come in full-service restaurants, non-casino hotels, and limited-service restaurants. Within the more traditional gaming component of the sector, casino hotels and other gaming establishments have been home to marked job declines. Along the same lines, over the past few decades, more and more of the revenue generated on the Las Vegas Strip has come from non-gaming sources. In fact, well more than half of total Strip revenue comes from non-gaming activities.

On a related note, Nevada's economic development efforts are concentrated in nine different sectors, ranging from tourism/gaming/entertainment with 382,000 jobs, to agriculture with 5,800 jobs. Within the economic development community, considerable attention is paid to the jobs "multiplier." This concept captures the stimulative impact of jobs due to an infusion of investment, and is designed to capture the total increase in jobs as that investment circulates throughout the economy. The manufacturing sector has the largest stimulative impacts, as measured by the jobs

multiplier. For every increase of 100 initial factory jobs, another 250 will be created (a multiplier of 3.5) as new activity circulates throughout the economy. The clean energy sector also has a multiplier in excess of three. All told, each of the nine sectors has a jobs multiplier of at least 1.9.

While our monthly analyses are on the more "traditional" measures of employment from the Current Employment Statistics (CES) and Quarterly Census of Employment and Wages (QCEW) Programs, there are other aspects of the total employment base. Using modeling tools from Economic Modeling Specialists, Inc. (EMSI), we have been able to estimate those other components of the labor market.

To measure total employment, we first start from a base of QCEW, which is a complete count of jobs from wage records submitted by employers covered under the State's Unemployment Insurance System. In 2013, this measure of employment is trending at about 1.16 million, a seven percent gain over the past decade. Some workers are not subject to unemployment insurance laws, and therefore, not captured in the QCEW statistics. This segment is referred to as "non-covered" employment. Nevada law exempts churches, real estate agents and brokers, student workers, etc. from paying the unemployment insurance tax.

Another instance where employment is not accounted for under the unemployment insurance system is

federally covered workers. This category of worker is found mainly in industries such as railroads and the military. According to EMSI, about 37,100 employees are classified as non-covered in 2013, a gain of nearly 15 percent over a decade.

In addition, there are the self-employed. There are nearly 70,000 of these workers, up eight percent over the ten-year period ending in 2013. Finally, there are “extended proprietors.” These individuals have jobs that do not generate their main source of income. Common examples include some individuals in real estate and finance. Some beauty salon workers are another often-used example. Extended proprietors total slightly over 300,000 in Nevada. (It is important to note that there may be some overlap. Individuals classified as extended proprietors may also be classified under other categories, such as QCEW, where they earn their main source of income.)

Perhaps most importantly, extended proprietors grew in excess of 70 percent over the decade ending in 2013, the largest gain of any worker category. This suggests that many Nevadans may have become

involved as an extended proprietor to supplement lost or reduced incomes as the recession took hold on the State.

Last month, we examined employment trends amongst Nevada’s black workforce, using the Census Bureau’s Local Employment Dynamics (LED) Program. This month we take a deeper look at what industries employ black workers in Nevada in order to help us eventually understand why their unemployment rate is almost twice that of whites. In the last quarter of 2012, about a quarter of black workers were employed by the accommodation and food services industry. The share of the black workforce in Nevada in retail trade is almost thirteen percent. The health care and social assistance accounts for about twelve percent of black employment in the Silver State, nearly identical with the administrative support/waste management sector. About eight percent of black workers are employed by the education sector. Next month, we will measure whether black workers were disproportionately represented in the industries hit hardest by the recession.

Nevada
